Animated Explainer Videos in Claude Code

Install the 66-style film skill, run your first film, and build a style around your own brand.

Why I use this instead of a video model

Every AI video tool I had tried before this one bills by the second and forgets what it did in the last shot. You pay per generation, the second clip never quite matches the first, and the only fix is to reroll and pay again. For an explainer, where the whole point is that frame two looks like frame one, that is a bad trade.

Lemo-Opuscar takes a different route. It is an open source Claude Code plugin that renders films in code. Canvas and WebGL draw the picture, a text-to-speech engine speaks the narration, a score is written for the piece, and FFmpeg puts the three together. No video generation model is called at any point, so the render costs you nothing in credits. A 45 second film and a six minute film cost the same.

The library ships with 66 or more styles, each one a written specification rather than a prompt you hope lands twice. You pick a style, describe your idea in plain English, and the agent handles the story, the voiceover, the storyboards, the music and the sound effects. Your hands-on time is a few minutes. Then you walk away while it renders.

01

How it actually works

1. You name a style and a topic. The agent reads three guides to decide what to make: DIRECTOR.md for story, sound, rhythm and camera, TECHNIQUE.md for frame rendering, voice synthesis and music mixing, and styles/
