

The G-Stack Playbook

Set Up a 23-Tool Claude Code Ops Team Like Garry Tan's

01

What G-Stack Actually Is

G-Stack is Garry Tan's open source Claude Code setup: 23 tools that add specialist agents to your normal Claude Code workflow. Instead of one assistant handling every task, each prompt gets routed through the agent built for that job.

QUICK TIPS

- Install once per project, not once per task
- Works passively — you don't have to name agents manually

02

The 5 Core Agent Roles

Five roles do most of the work: a CEO agent that questions product direction, a designer agent that catches generic AI-generated UI, an engineering manager agent that protects the architecture, a QA agent that opens a real browser to test, and a release manager agent that ships.

QUICK TIPS

- The QA agent is the one solo builders skip most — don't skip it
- The CEO agent runs first, before any code gets written

03

How to Install It in Your Own Project

G-Stack installs with a single command inside any Claude Code project, registering all 23 tools at once. There's no manual config file to write per tool. Once installed, restart your Claude Code session and the agents become available automatically.

QUICK TIPS

- Run the install command from your project root, not a subfolder
- Confirm the agents loaded by starting a new session before your first real task

Customizing Agents for Your Workflow

Because G-Stack is open source, every agent's instructions are editable text files. You can tighten what the designer agent flags, loosen what the engineering manager enforces, or add your own specialist agents alongside the default 23.

💡 QUICK TIPS

- Start from the defaults for two weeks before customizing — you'll know what actually needs changing
- Keep a backup of the original agent files before editing

Common Pitfalls to Avoid

The most common mistake is installing G-Stack and then still prompting Claude Code to skip steps 'just this once.' The value comes from letting every agent run every time, especially the QA and release manager agents on anything shipping to real users.

💡 QUICK TIPS

- Don't let a tight deadline talk you into skipping the QA agent
- Review the engineering manager agent's architecture notes weekly, not just when something breaks
