

The Motion Playbook

4 Claude Code Skills for Remotion Motion Graphics That Don't Look Like Slop

01

Skill 1 — Purposeful Motion

Aimless zooms and random drifts are what make AI video look cheap. This skill tells Claude Code to give every animation a job, so each movement reveals the idea on screen instead of filling time. Decide what the shot has to land, then animate only the element that carries it.

💡 QUICK TIPS

- One idea per shot, one element to carry it.
- Hold everything else still so the motion reads.

02

Skill 2 — Shot Cohesion

Jarring cuts and mismatched styles break the flow and signal a template job. This skill keeps color, pacing, and easing consistent across every shot so the whole piece feels like one deliberate video. Cohesion is what turns a set of clips into something that looks produced.

💡 QUICK TIPS

- Reuse the same easing curves across shots.
- Lock a small color set and stick to it.

03

Skill 3 — Real Demos

Fake screen recordings are an instant tell. This skill makes computer and app demos read as genuine, with realistic layouts, cursors, and states instead of the plastic mockups AI reaches for by default. Real-looking demos build trust with the viewer in seconds.

💡 QUICK TIPS

- Show a real cursor and real interaction states.
- Match the app's actual layout, not a generic frame.

Skill 4 — Focus Highlight

A frame where five things move at once reads as noise. This skill points the eye at the single thing your audience needs to see, using a clean highlight, scale, or reveal. When emphasis is obvious, the message lands without the viewer working for it.

💡 QUICK TIPS

- Emphasize one detail per frame.
- Use scale or a highlight, not more motion.

Bonus — Use the Right Logos

All four skills tell Claude to use the correct brand logos instead of guessing, so a product shot shows the real mark rather than a placeholder. Install the skills once in Claude Code, then call them by name while you build each Remotion scene. Because the rules live in the skills, your tenth video looks as sharp as your first.

💡 QUICK TIPS

- Reference the skill by name in your prompt.
- Layer one skill per shot, then render with Remotion.

Ready to go deeper?

This playbook is the short version. Inside the hub you get the full build walkthroughs, the prompt library, and the systems I use to ship this in a weekend.
